02. Periodic Classification of Elements

1. State Dobereiner's law of triads and explain it with one suitable example.

2. State Newlands' law of octaves. Mention any two limitations of this law.

3. Explain the main features of Mendeleev's periodic table.

4. State any four merits of Mendeleev's periodic table.

5. State any four demerits (limitations) of Mendeleev's periodic table.

6. State the modern periodic law.

7. Describe the structure of the modern periodic table with reference to periods and groups.

8. Explain how electronic configuration decides the group number of an element in the modern periodic table.

9. Explain the trend in atomic size (atomic radius) (a) across a period and (b) down a group.

10. Explain the trend in metallic and non-metallic character in the modern periodic table with one example each.
