ACIDS, BASES AND SALTS

1. What is neutralization reaction? Give two examples.

2. What is observed when carbon dioxide gas is passed through limewater
(a) for a short duration?
(b) for a long duration?
Also write the chemical equations for the reactions involved.

3. While diluting an acid, why is it recommended that acid should be added to water and not water to the acid?

4. What is universal indicator? State the purpose for which this indicator is used.

5. How does the enamel of the teeth undergo damage due to the eating of chocolates and sweets? What should be done to prevent it?

6. Differentiate between strong electrolytes and weak electrolytes. Mention two examples.

7. (a) In a tabular form write the colours of the following indicators in presence of acid and base: Litmus solution, phenolphthalein solution, methyl orange solution.
(b) Classify the following given solution A and B in acidic and basic, giving reason.
Solution A: $[H^+] < [OH^-]$
Solution B: $[H^+] > [OH^-]$

8. Give the formula of bleaching powder and write two applications of it.

9. How is Plaster of Paris chemically different from gypsum? How can they be interconverted? Write any two uses of Plaster of Paris.

10. What is chlor-alkali process? Write its chemical equation. Which gas is evolved at cathode and anode? Write any two uses of hydrochloric acid and bleach so formed as products.
